LOAD BEARING CHARTS

Foundation Screws Ireland

The values of the load bearing capacity of the ground screws are determined on a 'semi-solid loam' type of soil.

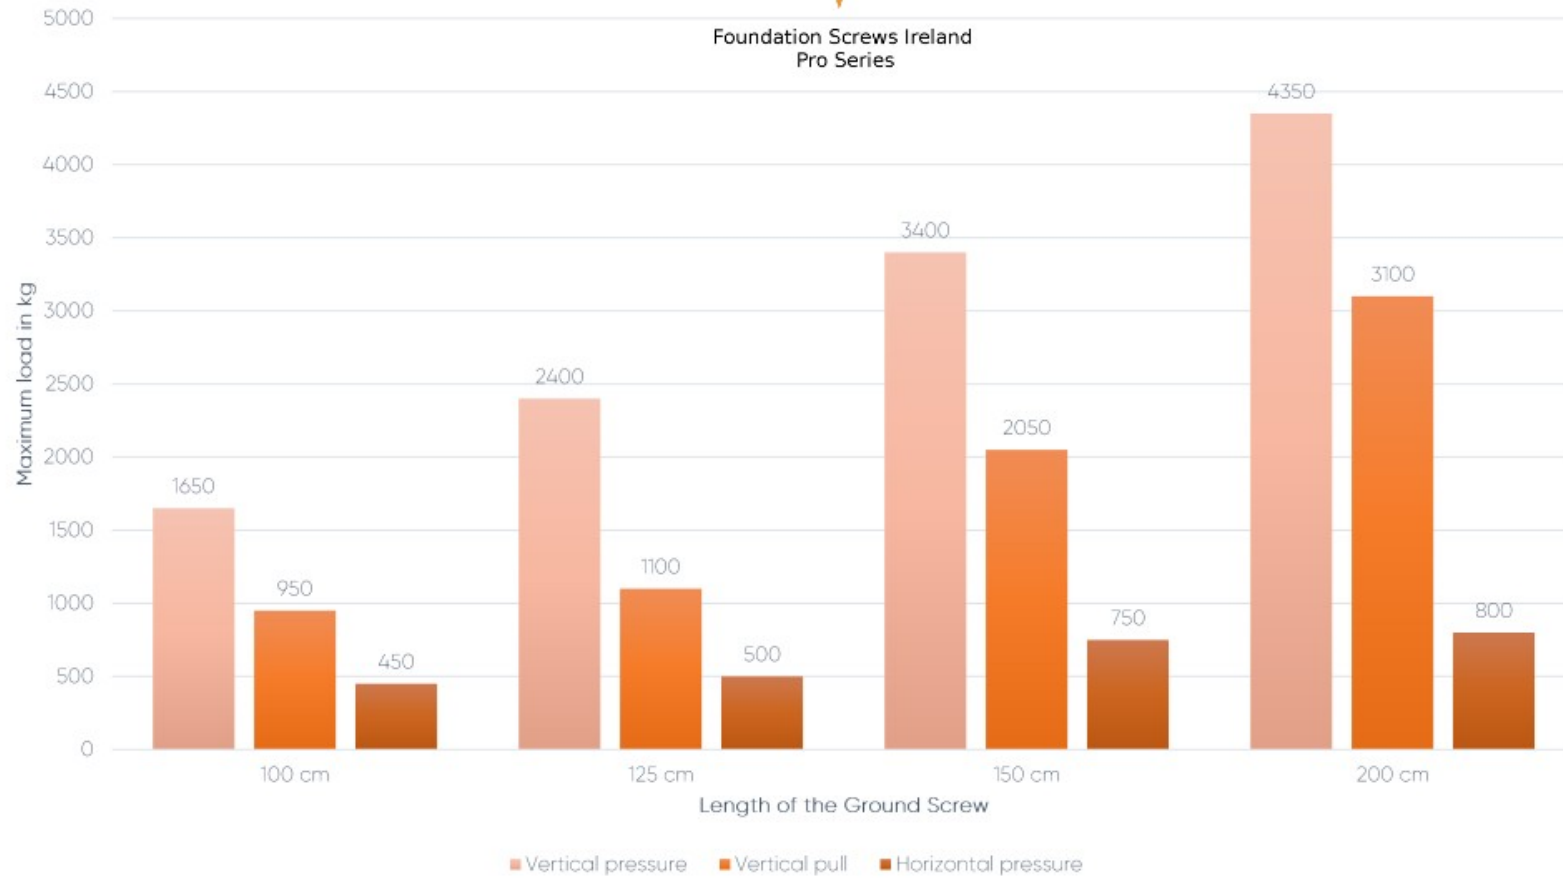

The values have an added safety factor of 35%. Values in the charts are an **approximation.**

The needed depth of the ground screw is based on a static calculation combined with a cone penetration test or a push-test on site.

The producer is not responsible for any damage caused by a wrong choice in type of ground screw.
